The i 22 kD antigen, antigenic fragments antibhodies can be used in a vaccine for the prevention of infection by N. meningitidis by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antiger

The iso 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis of by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis

The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis of by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis

                                                                                                                                                                                                                                                                                                                                                                                  developed as a vaccine for the prevention of meningococcal disease caused by all serotypes. The invention provides combination compositions comprising: (i) 2 or more Meisserial nucleic acids; or proteins, (ii) 2 or more different Neisserial nucleic acids; or (ii) mixtures of 1 or more Neisserial protein and 1 or more Neisserial nucleic acids are preferably from different Neisseria spn., especially Neisseria meningitidis and Neisseria gonorrhoeae, but may be from the same species. A claimed composition includes the NBPA protein, preferably in mature form. The compositions are used e.g. as immunogenic compositions, vaccines or diagnostic reagents. They are used to treat or prevent Neisserial infection, to detect the presence of Neisserial bacteria or of antibodies raised against Neisserial bacteria, and/or as reagents which can raise antibodies
                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAR73911 is the Neisseria meningitidis opacity related protein POPM3. It contains the meningitis related antigenic sequences (MRHAS) claimed in AAR73889 and AAR7391, which are recognised by a monoclona antibody from the hybridoma Rubella virus (RV)-1. The claimed MRHAS peptides may be used in immunoassays to diagnose the presence of bacterial and/or viral meningitis agents in a sample, or in prophylactic and therapeutic meningitis treatments. The peptides may also be used as vaccines against meningitis.

invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa aureus faccalis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of the printed specification, but was obtained in electronic format directly from WIPO at
             Non-typable Haemophilus influenza (NTHi) fimbrin protein.

Thus frimbrin isolated from non-typable Haemophilus influenzae 1128 strain is a particularly suitable immunogen to protect against the different non-typable HJ. influenzae that cause otitis media. Finbrin protein is produced by culturing a transformed microbial host, pref. E.coli, Sporodoptera frugiperda or a mucosal pathogen. Fimbrin protein (FP) produced by this process is claimed. The FP protech migrates in polyacrylamide genes to a posn. equiv. to a mol. wt. of 25.5 kD or 37.5 kD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine comprising non-typable Haemophilus influenza fimbrin protein - useful in studying, preventing or reducing the severity of otitis media, also fimbrin protein and DNA.

The amino-terminal and trypsin fragments are sequenced and a series of oligonucleotide probes constructed corresponding to the established sequences. These probes used to screen a gene bank of 15-20 kb fragments of genomic DNA in lambda EMBL 3. One positive clone includes a 15 kb insert conty. the protein gene, which can be isolated as a 2.5 kb pstI fragment of the ground int a high copy no. vector because of the toxicity of the gene prod... so is subcloned as two fragments with an overlapping region of about 500bp. Ab's are raised by usual immunisation or cell-fusion procedures. The Ab's are useful in diagnosis.

                                                                                                                                                                                                                                                                                                                               The present invention relates to a Campylobacter jejuni or Campylobacter coli fibronectin binding protein (CadF). A recombinant expression vector with cadF is useful in an assay for determining the presence of C.jejuni or C.coli in a test sample or for determining whether a test isolate of Campylobacter is a strain of C.coli. cadF is useful in the construction of DNA probes for identifying and quantifying the level of expression of CadF in a cell. The gene can also be used in a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated polynucleotide useful for producing fibronectin binding proteins which are useful in production of vaccine, in diagnostic assays and for prophylactic and therapeutic purposes .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    05-DEC-2000

                                                                     This sequence represents the major outer membrane protein P5 of non-typeable H. influenzae. One or more surface exposed loops of this protein may be replaced with a modified peptide of the invention. Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP P5 from strain ntHill28, representing amino acids Arg117 to Gly135. This peptide represents the third exposed loop of P5 and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP P5 may be used to induce an immune response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection.

The present invention relates to virulence genes from Pasteurellaceae. The present sequence is a protein encoded by one such virulence gene. The virulence genes of the present invention may be mutated in order to produce an inactive gene. The inactive virulence gene may in turn be used to produce a vaccine, which is useful for treating bacterial infections such as septicemias, bronchopneumonias, rhinitis and
